Design Concept

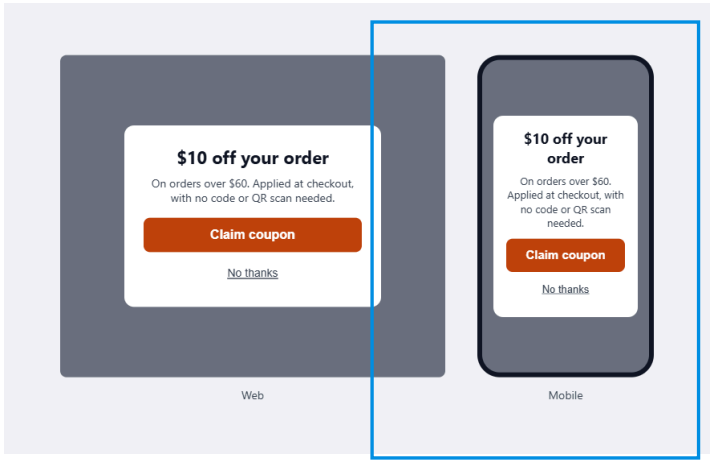

Some ideas that will be shown are adding filters to the “Lightening Deals” page, ensuring that coupons work and can be redeemed on the web, and adding a “recently viewed items” list when clicked.

Adding filters to the lightning deals page would increase consistency across the website, and help users find exactly what they’re looking for faster.

This image shows the “recently viewed” section under the item that was selected. Users can be reminded of previous items they might’ve liked, and see the prices to compare deals.

This image shows users being able to redeem coupons and pop-ups on the web. Currency, one issue users run into is having to scan a QR code from their phone because these coupons/pop-ups can only be redeemed on the mobile interface. Now users can take advantage of the coupons without having to use another device.

AI Assistance

I used Claude I used Clause and gave it my three design ideas and asked it to sketch them out. It gave me three wireframes: a sort and filter bar, a coupon pop-up for web and mobile, and a recently viewed row. The wireframes are AI-generated from my ideas and our study findings, and I reviewed them for fit with our research. Below is the prompt.

> “Ensure all pages have a filter/sort option (consistency). For the coupons/discounts on the web, change the QR code scanner. Have the popups be usable on both mobile & web. Recently viewed when items are clicked instead of a new tab being opened when you click an item. These are my ideas, show me what this would look like sketched out”
